

WebFOCUS App Studio General Availability Release

April 10, 2014

The Business intelligence Products Group is developing App Studio, the next-generation WebFOCUS full-client development product to replace the Developer Studio product.

App Studio makes use of the common design paradigm seen in today's Windows® products: the ribbon, panels, and development canvases. With this major paradigm switch, the product name *App Studio* was selected to emphasize the experience of working within a single tool to develop WebFOCUS Applications.

App Studio is provided to registered users as a product download from the Technical Support website. The product requires the WebFOCUS Client Release 8.0 Version 07 for remote development, and the required patches that are also provided on the download site.

App Studio may be configured as a stand-alone product, or may use the WebFOCUS Client Release 8.0 Version 07 context roots, if installed on the same machine. The App Studio online Help system is available for guidance through this new and innovative user interface. Please contact Customer Support Services to obtain assistance or to report any issues.

The WebFOCUS division and I look forward to working with you as we introduce this new and exciting product into the WebFOCUS family.

Thank you,

David Glick
